

# Save time and money with EurTradeNet experts help

**Although Europe is a single market, transporting goods across borders still generates a heavy administrative workload and complex paperwork. Often, various agencies in different countries are involved and international traders need to liaise with a number of corresponding Customs offices.**

We offer integration consultancy services to ensure your companies IT resources achieve the full range of ETN services. The data needed is obtained and kept in your system, easing the flow of information, avoiding repetitive tasks of data entering, allowing for advanced data mining and business intelligence integration from your trade processes.

UIDS (Unified Interface Data Structure) makes it possible. ETN provides the integration services needed using the UIDS standard to interface with your corporate information systems. The building of the UIDS space makes possible to direct the conversation with customs procedures within your own system functionality.

The UIDS space created in your company bridges the ETN network, the customs administrations and your corporate systems, regardless of the country your facilities are located in. This is a key advantage for trans-national companies that can use UIDS and ETN to connect with customs in several countries.

# Global vision combined with local knowledge makes ETN an invaluable partner in the supply chain

Customs administrations in Europe are regulated by the European Commission which requires all importers and exporters in the 27 Member states to provide common customs data. After many years of experience in dealing with these Authorities ETN understands that there are in fact several crucial differences in both the behaviour of certain Customs systems and indeed the data requirements.

ETN has developed a common data language called UIDS (Unified Interchange Data Structure). UIDS give any pan European importer or exporter access to over 12 EU Customs Authorities. UIDS is open standard using XML (eXtensible Mark up Language) which makes both implementation and integration with own systems very straight forward.

The local ETN partner will be responsible for the delivery of messages to and from the local Customs Authorities. All ETN companies have at least a decade track record of dealing in the electronic customs arena and you are buying into the largest network of independently owned Customs professional organisations.

UIDS has been built in such a fashion that it is easy to add on modules to incorporate any future changes in the Customs legislation that may affect existing users. UIDS can also be deployed by software providers and solutions integrators.

Global vision combined with local knowledge makes ETN an invaluable partner in the supply chain.
